Indosoft — junior *Web Developer*

2011 - 2013

1. Create Website using Wordpress, joomla and Magento
2. Day to day a Convert design to HTML

PROJECTS

MLM Web App — *Detail*

This application is made from **WordPress multisite**, which is an application with **one core** but can create many websites with subdomains and custom themes.

This application is a tool for **recruiting** new members and **selling**. If there is a new user, they will get a subdomain with full control of the user such as ***https://wordpress.org/***, where the content and themes are managed by the user.

Almost all features use **Woocommerce**. We created a **custom plugin** for a new user, a sales tool that uses the **Rest API** from Woocommerce, so that all transactions and products are on the main website.

I'm leading this project and develop too

Vehicle Service Management — *Detail*

This application is made using **Lumen** as **BE** and **Vue** as **FE**. This application records all repairs made to a BUS. This application is 1 project but BE and FE but these are separate applications. that can run independently by connecting using **REST API**, so they can still be used by mobile applications and updatable.

I'm develop this app from scratch

Social App — *Detail*

This is a **Social media App** like Facebook, has a timeline, has a group and a timeline based on the group. this App use for people have business

This App uses **Amity** as a social media engine built with **React js** as **Front end,** coupled with **hapi js** to store data other than social media, and **strapi** for the blog & course feature

Build using **docker**, **React**, **hapi js** , and **strapi**. We also make **Unit tests** in FE and **E2E Test** every page using **cypress**

React Js/Native App — *Detail*

We created a mobile app for hotels during the pandemic, a place to **self register** without contacting customer service. This application uses a selfie photos machine based on android , and is connected to an **ID card scanne**r.

Besides that there is also an **HR application** that has been released on the playstore. This app is used for job **checkin** & **checkout**, **payroll**, leave clearance and **reports** for each division.
.

Wordpress App — *Detail*

We make applications with wordpress with **custom themes** and **custom plugins**. Where is root.io/sage for the starter theme. We also use **Scss** or **Less** in making the style.

The most memorable experience was creating an **MLM** system using Wordpress Multisite with a downline recruitment system and sales from stockists.
